Project Design Phase - I

Solution Architecture

Date	2 november 2022
Team ID	PNT2022TMID31050
Project Name	Project – Smart Farmer-IoT Enabled smart Farming Application
Maximum Marks	4 Marks

Solution Architecture:

- The different soil parameters (temperature, humidity, light intensity, pH level) are sensed using different sensors and the obtained value is stored in IBM cloud.

- Arduino uno is used as a processing unit which processes the data obtained fromsensors and weather data from weather API.

- Node red is used as a programming tool to wire the hardware, software and APIs.The MQTT protocol is followed for communication.

- All the collected data are provided to the user through a mobile application which was developed using MIT app inventor. The user could make decision through an

app, whether to water the crop or not depending upon the sensorvalues.
